

Abstract of the Disclosure

An integrated circuit device is described which includes a voltage reduction circuit to reduce an externally supplied voltage using a transistor threshold drop. The transistor is fabricated in a well to isolate the transistor from the integrated circuit substrate. The transistor can be fabricated with a lower breakdown voltage level and still reduce a high voltage. The transistor can also be fabricated in the same manner as other transistors in the integrated circuit. A voltage regulator circuit is also described which incorporates the reduction circuit to allow the use of transistors which are not designed to handle an external voltage V_{pp} .
